Studengage

The right university information, in front of the **right student**.

Today it takes eight places to check — and not one of them knows who the student is.

Emmanuel

Mariana

SPECIFIC CUSTOMER

A second-year undergraduate

Enrolled at a Nova Scotia university, living off campus, working part-time around a fixed class timetable.

- Not an applicant — this is **student life**, not recruitment
- The buyer is the university's **student-services office**

RECURRING DIFFICULTY

The same hunt, every cycle

It restarts from nothing each time, across **eight disconnected channels**.

- **Events** — every week
- **Bursary deadlines** — every term
- **Co-op postings** — every hiring round

WHY IT MATTERS

Opportunity quietly expires

Funding unclaimed. Placements missed. Professional networks left thin.

- The university's outreach lands in the **wrong inboxes**
- Dissatisfaction is the symptom — the cost is **what nobody saw in time**

50% of students are dissatisfied with how information about their own student life reaches them. **Half the student body, every term.**

Six steps — and the university keeps publishing exactly as it does today.

01

University publishes

Staff post once, by form or CSV upload: the same text they already write. Nothing is scraped.

02

Student declares a profile

Program, year, campus, hours free, interests. Five fields.

03

Filter, then rank

Not eligible or clashes with class? Out. The rest is scored, and every card shows **why**.

04

Student gets a short feed

Only what applies, each with its deadline, and at most five alerts a week.

05

Student acts

Applies, attends or claims — on the university's own page.

06

The feed sharpens

02 / THE SOLUTION / AI & VALUE

The engine ranks and matches. That is the entire job.

WHAT WE BUILT · ROLE FOR AI

- **Built:** a ranking engine you can read. Interest 35 · schedule 20 · deadline 15 · distance 10 · preferred 10 · peers 10
- **Distinctive:** it knows the timetable. It hides what clashes with class, allows travel time between campuses, and says `"3 of 4 sessions fit"`
- **Where AI fits next:** reading free-text postings into tags and criteria, so staff don't fill in fields. The prototype runs **no AI model yet**, by design: every rank can be explained
- It never writes content, judges eligibility, or acts for the student

CONVINCING VALUE

- **Student:** five minutes of setup replaces a weekly hunt — the bursary deadline arrives **before it closes**
- **University:** announcements it already pays to publish finally land. No new channels, no new staff, no new content
- **Nothing depends on new behaviour.** The change sits in the middle — cheapest to add, easiest to remove

Private by not collecting. Measured from day one.

- **No health information.** Nothing we hold falls within PHIA's scope, because we never ask for it.
- **Student-declared fields only** — visible to the student, editable any time.
- **Only the university's own postings.** No scraped data, no purchased data.
- **Equity self-ID is opt-in** and used only to check eligibility, never to rank. No brokers, no resale.
- **Reversible consent.** One stated purpose, plus export and delete on request.

PILOT TARGET · AN ASSUMPTION

+30%

relevant reach per announcement: the share of the right students who actually see it, compared with the broadcast baseline.

TESTED	50% dissatisfied, from our own student research
SIMULATED	Broadcast vs Studengage on 256 synthetic students, live in the demo
ASSUMED	The 30% lift with real students, until the pilot measures it

NEXT STEP

One institution, five streams, one term — with the baseline captured on **day one**.

A Nova Scotia university's student data falls under the province's FOIPOP Act; PIPEDA applies to us as a private vendor. Design intent, not a legal opinion: confirm with the institution's privacy office before launch.

04 / LIVE DEMO / BLUENOSE UNIVERSITY, A FICTIONAL CAMPUS

Same postings. Different student, different feed.

Open the prototype `localhost:3000 →`

1. **University side.** Upload the demo CSV of 30 postings and watch who is matched, notified, or blocked by a class clash.
2. **Student side.** Switch from Amara (Chemistry) to Wei (first-year CS). Same postings, two different feeds, each card with its reasons.
3. **Impact panel.** Broadcast vs Studengage: relevant reach on the simulated students.

WHAT WORKS

- Post by form or CSV upload; every student is ranked and notified at once
- Eligibility rules, class-clash check, reasons on every card, five-alert weekly cap
- Interested / Not interested and attendance answers change the next ranking

WHAT IS SIMULATED

- All students: 6 personas plus 250 generated. No real student data
- Bluenose University is fictional; runs locally, with no real sign-in
- No AI model yet: ranking is a transparent formula
